1. General Description

Vchungs' VC-QSFPDD-400G-SR4 is an four-Channel, Parallel, Pluggable, Fiber-Optic QSFP-DD Module for 400Gigabit Ethernet applications. This product converts 8 channels of 26.5625GBd electrical input data to 4 channels of 53.125GBd parallel optical signals. Reversely, on the receiver side, 4 channels of parallel optical signals of 53.125GBd converts to 8 channels of 26.5625GBd electrical output data. This module is designed to operate over multimode fiber systems using a nominal wavelength of 850nm, up to 60 meters over OM3 MMF or 100 meters over OM4 MMF.

As shown in the table above, the VC-QSFPDD-400G-SR4 supports 4 applications, IB HDR 400GBASE-SR4 and Ethernet 400GBASE-SR4,200GBASE-SR2,100GBASE-SR1.

5.2.2 Application Selection and Instantiation

The host can select Applications by programming the AppSel value in Staged Set 0. AppSel=1 is the default Application populated in the Active Control Set at power-on or reset.

* Note that the channels of the module are independent and can be configured separately.(ie. up to four 100GBASE-SR instances can be configured), however, it does not support different applications with different channels at the same time.

VC-QSFPDD-400G-SR4 supports two methods of application selection and instantiation. The first method is implemented according to CMIS, and the second method is customized, which is simpler.

1. First method:

The applications switching configuration sequence is as follows: read Application Descriptor Registers and select the required Appsel. Write application configuration to DPConfigLane<i> in Stage Control Set 0, then write 1 to ApplyDPInitLane<i> to trigger Application Instantiation. The Active Set can be read from page11h.

For example, select AppDescriptor3:

Step 1: Write 0x30 in Page10h Byte145~Byte152(8 bytes)—Set AppselCode3

Step 2: Write 0xFF in Page10h Byte143—Set trigger register to run Application Instantiation.

2. Second method:

Set the value of Page10h Byte240. This is a private definition.

Notes:

1.QSFP-DD uses common ground (GND)for all signals and supply (power). All are common within the QSFP-DD module and all module voltages are referenced to this potential unless otherwise noted. Connect these directly to the host board signal common ground plane.

2.VccRx, VccRx1, Vcc1, Vcc2, VccTx and VccTx1 shall be applied concurrently. Requirements defined for the host side of the Host Card Edge Connector are listed in Table 6. VccRx, VccRx1, Vcc1, Vcc2, VccTx and VccTx1 may be internally connected within the module in any combination. The connector Vcc pins are each rated for a maximum current of 1000 mA.

3.All Vendor Specific, Reserved and No Connect pins may be terminated with 50 ohms to ground on the host. Pad 65 (No Connect) shall be left unconnected within the module. Vendor specific and Reserved pads shall have an impedance to GND that is greater than 10Kohms and less than 100 pF.

4.Plug Sequence specifies the mating sequence of the host connector and module. The sequence is 1A,2A, 3A, 1B, 2B, 3B. (see Figure 2 for pad locations) Contact sequence A will make, then break contact with additional QSFP-DD pads. Sequence 1A, 1B will then occur simultaneously, followed by 2A, 2B, followed by 3A, 3B.
